Bamboo Floating Floors

Teragren™ introduces the Portfolio collection of strand bamboo floating floors. Engineered with proprietary Xcora™ technology, the bamboo fibers are fused with an adhesive under extreme pressure to form homogeneous, high-density panels. The seven-coat finish includes a wear layer of abrasion-resistant aluminum oxide, plus two scratch-resistant polyurethane topcoats. Its finish is water-based and solvent-free. Wide planks and a fold-down, self-locking system make installation easy. The flooring averages 154 percent harder than red oak, making it appropriate for high-traffic installations. Ten new colors are available (pictured: Paris Black). Eligible for two LEED credits, for Rapidly Renewable Materials and Low-Emitting Materials — Flooring Systems.
